# CLOUD COMPUTING PRACTICAL 8:AMAZON SAGEMAKER

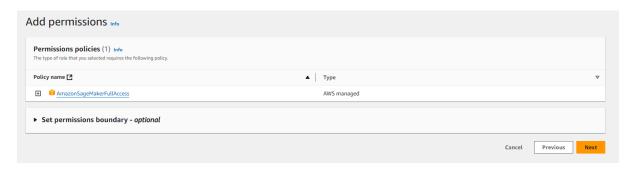

# Krishn Ahuja

# <u>A001</u>

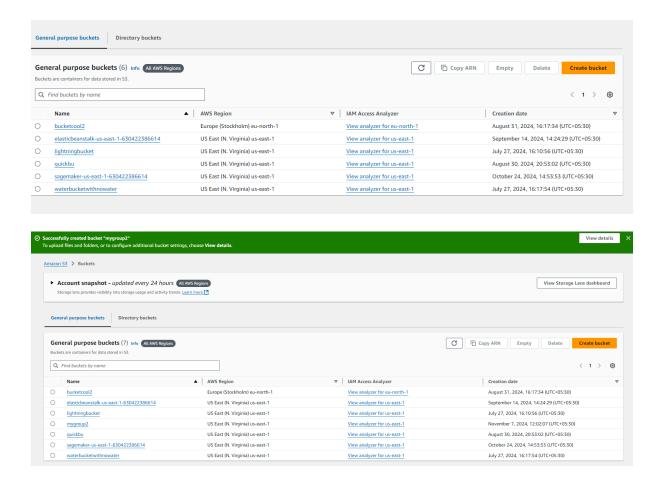

# 1)Creating IAM ROLE and assigning sagemaker permission

IAM > Roles > Create role		
Select trusted entity	Select trusted entity Info	
Step 2 Add permissions	Trusted entity type	
Step 3 Name, review, and create	AWS service Allow AWS services like EC2, Lambda, or others to perform actions in this account.  O WS accounts belonging to you or a 3rd party to perform actions in this account.  O Web identity Allows users federated by the specified external web identity provided to assume this role to perform actions in this account.	
	O SAML 2.0 Federation Allow users federated with SAML 2.0 from a corporate directory to perform actions in this account.  Count.	
	Use case Allow an AWS service like EC2, Lambda, or others to perform actions in this account.	
	Service or use case	
	SageMaker ▼	
	Choose a use case for the specified service. Use case	
	<ul> <li>SageMaker - Execution</li> <li>Allows SageMaker notebook instances, training jobs, and models to access 53, ECR, and CloudWatch on your behalf.</li> </ul>	
	SageMaker - HyperPod Clusters Allows SageMaker HyperPod to call AWS services on your behalf.	

## IAM Role is created.

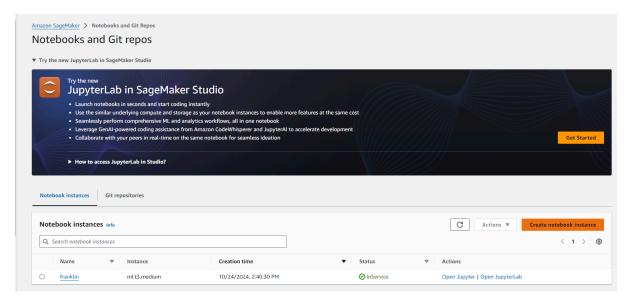

2) creating s3 bucket named mygroup2

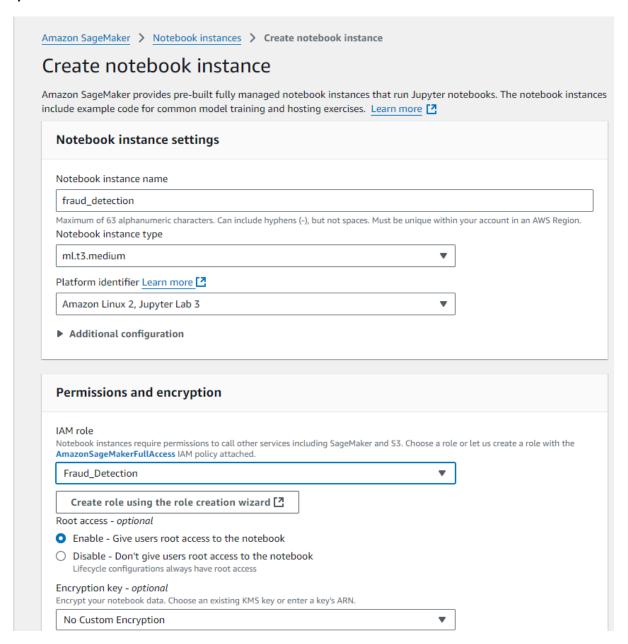

#### 3) open Amazon SageMaker console

#### Select Notebook instances and click create notebook instances

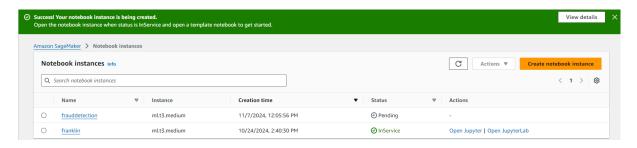

Here we will assign the IAM role created earlier i.e fraud\_detection

#### 4) CREATE A JUPYTER NOTEBOOK

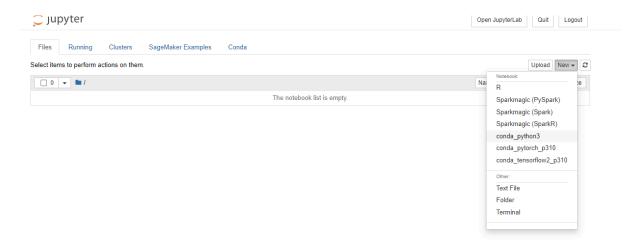

### Notebook is created

1. Open Jupyter or JupyterLab according to the interface needed.

- 2. Go to File menu->Choose New-> Notebook.
- 3. Select Kernel as 'conda\_python3'

## Deploying the model (Here it is stored in s3 bucket that we had created)

```
In [1]: import shap
                X, y = shap.datasets.adult()
                X_display, y_display = shap.datasets.adult(display=True)
feature_names = list(X.columns)
                Matplotlib is building the font cache; this may take a moment.
